**Subject:** Update - Special

Dear Mr. Mike Tannura,

The GFS develops a major ridge of high pressure next week; centered on the eastern Rockies and western Plains. Although it hinted at such development earlier, it is much more impressive because it fails to develop a strong system across the northeastern United States late next week. This was discussed on page 7. It does develop a few t-storms across the eastern Corn Belt as the ridge develops on Friday. Thereafter, hot weather focuses on western areas -- but eastern areas would not be particularly hot because they would be dominated by northwesterly winds.

Interestingly, the exact same scenario was suggested by last night's Canadian. We disregarded its output because it has been fluctuating. More coming up.

Thank you for your business and have a good day.

Mike
